

WILSY OS AI INLINE COMMAND PLAYBOOK - FG108

Authority • Review • Execution • Forensic Proof • Source-Aware Control

DOCUMENT CONTROL

ISSUING ENTITY	Wilsy (Pty) Ltd
COUNTERPARTY / TENANT	wilsy-sovereign-root
EFFECTIVE DATE	2026-07-09
GENERATED BY	Wilson Khanyezi
VERSION	WILSY-OS-KNOWLEDGE-BASE-FG108-v1.0
JURISDICTION	Republic of South Africa
SOURCE POSTURE	KNOWLEDGE_BASE_VERIFIED
TRACE ID	fg108o3e3l-rich-live-user-playbook-1783608336
MERKLE ROOT	E7AC0A18AF3B...D83DFCABE88C

REVIEW AND RELIANCE NOTICE

This artifact is generated by Wilsy OS as an enterprise source-aware control document. It is not final for signature, external circulation, filing, regulatory submission, investor diligence, litigation or commercial reliance until reviewed by the responsible business owner and, where appropriate, legal, finance, security, privacy, compliance or executive leadership.

1. KNOWLEDGE BASE PURPOSE AND OPERATING CONTEXT

1. This artifact is a Wilsy OS knowledge-base playbook for investor review, user enablement, engineering continuity and controlled product governance.
2. Tenant: wilsy-sovereign-root
3. Generated by: Wilson Khanyezi
4. Source posture: KNOWLEDGE_BASE_VERIFIED

WILSY OS AI INLINE COMMAND PLAYBOOK - FG108

Authority • Review • Execution • Forensic Proof • Source-Aware Control

EXECUTIVE SUMMARY

1. FG108 proves that Wilsy AI can operate inside the production CRM Leads workspace as a continuous typographic response surface with governed inline command execution. The protected pattern is not an AI panel, not a static suggestion card, and not a separate command center. It is a production operating layer that answers, explains, routes actions, opens workspace views, and preserves evidence.

WHAT WAS COMPLETED

1. The work completed through FG108 includes the inline command runtime, DOM-auditable command metadata, proof controls for Open Proof Trail, Open Sort Command, Open Source Authority, Open Artifact PDF control, Open Evidence JSON control, and Run proof before export. The old `/api/crm/leads/views/proof-pack/export/pdf` route remains forbidden. Artifact PDF generation is routed through `/api/generate/pdf`.

FAILURE CHAIN AND CORRECTIONS

1. The export path exposed multiple production issues: missing PDF service dependency assumptions, unauthenticated artifact token failures, generic legal artifact routing, weak local PDF extraction, stale Generated By identity, hard-coded user/email fallback risk, and generic Wilsy OS Operator fallback. Each failure was treated as production evidence and corrected with guards, source maps, renderer changes, controller identity precedence, proof sidecars, and fail-closed live user identity behavior.

GENERATED BY IDENTITY RULE

1. Generated By must come from live authenticated backend user/profile information. Payload scripts must not hard-code a user name. Payload scripts must not hard-code an email. The renderer must not map handles to names. Knowledge Base PDF export must fail closed when the backend cannot resolve a professional profile display name.

KNOWLEDGE BASE PAYLOAD COMPLETENESS

1. A Knowledge Base artifact must preserve the product story, runtime contract, evidence route contract, tested proof, known failure modes, stable tags, future work, user training value, investor interpretation, and engineering do-not-break rules. It must be useful for a future engineer, a tenant user, an investor reviewer, and the Wilsy founder/operator reviewing continuity.

WILSY OS AI INLINE COMMAND PLAYBOOK - FG108

Authority • Review • Execution • Forensic Proof • Source-Aware Control

RUNTIME CONTRACT

1. Operator Kernel response links are rendered by the CRM Leads Operating Room as inline command buttons inside the continuous AI response surface. Commands must expose command, action, route, and id metadata in the DOM so they can be regression-tested. Commands must route into existing governed workspace actions and must not create silent mutations.

PDF AND EVIDENCE ROUTE CONTRACT

1. Artifact PDF generation must use `/api/generate/pdf`. Evidence JSON remains the proof-pack handoff. The old proof-pack PDF route must remain absent. Any export must include tenant identity, source posture, trace ID, Merkle root, request proof, and institutional headers sufficient for reconstruction.

STABLE POINTS AND PROTECTED TAGS

1. Important protected states include FG108M final AI inline artifact regression, FG108O3B2 enterprise knowledge renderer, FG108O3E1 Knowledge Base manifest guard, FG108O3H3 removal of Generated By hard-code, FG108O3J2 live user identity without email hard-code, and FG108O3K3C live user identity builder.

WHAT CAN BE DONE NEXT

1. The next safe product move is the global Knowledge Base Vault: a permissioned, searchable, printable knowledge surface that is available beyond Founder Dashboard. Founder/admin users should get publishing and curation controls. Tenant users should get approved guides, training material, how-to playbooks, product stories, and release explanations.

GLOBAL KNOWLEDGE BASE OPERATING MODEL

1. The Knowledge Base must not be hidden only inside Founder Dashboard. It should support global help/search access, permissioned audiences, approved artifacts, saved PDFs, source maps, proof sidecars, training guides, feature stories, and engineering continuity records. Generated PDFs should be saved once and reopened/printed later without regenerating.

DO NOT BREAK RULES

WILSY OS AI INLINE COMMAND PLAYBOOK - FG108

Authority • Review • Execution • Forensic Proof • Source-Aware Control

1. Do not restore the old proof-pack PDF route. Do not add AI cards, panels, chips, rails, or separate suggestion shelves for Wilsy AI. Do not hard-code user names. Do not hard-code emails. Do not use browser prompt or confirm. Do not let PDF exports fall back to lowercase handles, unknown emails, or Wilsy OS Operator for signed-in Knowledge Base exports.

USER TRAINING VALUE

1. A tenant user should be able to open this guide and understand what the AI inline commands do, where evidence exports come from, why proof checks exist, how artifact generation is controlled, and what actions are safe. The guide should help a real office user operate faster without needing to understand internal code.

INVESTOR INTERPRETATION

1. FG108 demonstrates a production-grade AI operating surface with governed actions, exportable evidence, source-aware artifacts, live user identity, and guard-enforced continuity. It is not a demo. It shows Wilsy OS moving toward a universal production operator across CRM, documents, meetings, finance, evidence, and tenant operations.

FUTURE ENGINEERING RULE

1. Every new inline command must include a manifest or source-map entry, DOM-auditable metadata, regression proof, and an evidence route contract. Every future Knowledge Base PDF must pass the manifest guard, source posture checks, professional live-user Generated By checks, and forbidden-text checks before it can be locked.

OPEN CAPABILITIES AFTER THIS ARTIFACT

1. After this lock, Wilsy OS can proceed to a Knowledge Base Vault UI, Playbook Factory guard, saved artifact library, global help/search entry, permissioned tenant read mode, Founder publishing controls, and automated generation of feature guides when stable tags are created.

APPENDIX A - KNOWLEDGE BASE PROOF CONTEXT

1. Trace ID: fg108o3e3l-rich-live-user-playbook-1783608336
2. Merkle root: E7AC0A18AF3B...D83DFCABE88C
3. Source posture: KNOWLEDGE_BASE_VERIFIED
4. Route: /api/generate/pdf

WILSY OS AI INLINE COMMAND PLAYBOOK - FG108

Authority • Review • Execution • Forensic Proof • Source-Aware Control

5. This appendix supports reconstruction, version comparison, investor diligence, user training and future engineering continuity.

KNOWLEDGE BASE AUTHORITY AND RETENTION

1. This Wilsy OS knowledge-base playbook is retained for investor review, user enablement, future engineering continuity and internal product governance.
2. It is not a counterparty execution artifact and must not display generic counterparty signature blocks.
